

1 On Page 29, the paragraph beginning at line 28 and continuing to Page 30 to end at line 2, should be
2 replaced with the following.

B2
3 FIGURE 10 shows an exemplary display image a viewer would see during a typical
4 presentation broadcast. The display image comprises an INTERNET EXPLORER™ browser
5 window 1195, which includes a primary frame 1196 and a secondary frame 1197. Secondary
6 frame 1197 is also referred to as the "nsframe." Secondary frame 1197 is further sometimes
7 referred to as a child frame, if the primary and secondary frames form a logical parent-child
8 relationship. As each presentation slide is displayed and animated during the live presentation, it is
9 displayed and animated in synchrony as slide image 1198 in primary frame 1196. At the same time,
10 live video content 1192 corresponding to the live presentation is replicated as visual image 1194
11 through the use of a WINDOWS™ Media Player application program control 1199 disposed in
12 nsframe 1197.

13 On Page 34, the paragraph beginning at line 16 should be replaced with the following.

B3
14 After the high- and low-bandwidth FTS file broadcasts are initiated, the global.js file
15 is updated in a block 1266. Once the ASF stream is created, an identifier is assigned to it.
16 This identifier is placed in an active stream redirector (ASX) file that is used to redirect the
17 attendees' browsers to link to the multicast broadcast source that is used to broadcast the ASF
18 stream during the live presentation. The updated global.js file now includes a variable that
19 contains a link to the ASX file. At this point, the "behind the scenes portion" of the
20 presentation broadcast preparation has been completed, and a check will be placed adjacent to
21 the "preparing presentation for broadcast..." text in presentation broadcast dialog 1200
22 (FIGURE 14).

23
24 On Page 35, the paragraph beginning at line 24 and continuing to Page 36 to end at line 2, should be
25 replaced with the following.

B4
26 After the system checks are complete, the user can initiate the presentation broadcast
27 by activating a start button 1216. This button is disabled until the system checks are
28 completed. The NETSHOW encoder is restarted, as shown by a step 1270 of FIGURE 13.
29 At a step 1272, the broadcast begins by broadcasting the ASF streaming audio/video content
30 of the live presentation directly to the attendees' computers (if a NETSHOW server was not
31 selected), or to the selected NETSHOW server. If a NETSHOW server is being used (either
32 on a local LAN or through a third-party provider), the NETSHOW server transmits the
33 audio/video content of the presentation (that it has received from the presenter's machine) to
34 the attendees via the ASF stream. As discussed below, as the presenter advances through the
35 slides of the presentation, script commands are embedded into the ASF stream to trigger
